

Web Appendix of

Public Health

in the Aftermath of Civil War:

A Spatial Time-Series Cross-Sectional Analysis

Yuta Kamahara*

December, 2022

* Yokohama National University (y-kamahara@ynu.ac.jp).

A Variables

Table A1: List of Variables

Variable	Database	Original Source	Variable Name in Database	Calculation Method
HALE	QoG	World Health Organization	who_halet	
Wartime Intensity	UCDP-BRDD		bd_best	binary (1 if Intensity > 0)
Population	UCDP-BRDD		bd_best	sum
Urban Population Growth	QoG	World Development Indicators	wdi_pop	arithmetic mean, log
Secondary School Enrollment	QoG	World Development Indicators	wdi_popurbagr	geometric mean
GDP per capita	QoG	World Development Indicators	wdi_gers	arithmetic mean
GDP Growth	QoG	World Development Indicators	wdi_gdpcapppcon2011	arithmetic mean, log
Polity Score	QoG	World Development Indicators	wdi_gdpgr	geometric mean
		Polity IV	p_polity2	arithmetic mean

—

Note: The abbreviations in this table are as follows. QoG: *Quality of Government Dataset* (Teorell et al. 2019); UCDP-BRDD: *UCDP Battle-Related Deaths Dataset* (Pettersson, Högladh and Öberg 2019). In the replication materials, I also utilize the *UCDP Onset Dataset Ver. 19.1* (Gleditsch et al. 2002, Pettersson, Högladh and Öberg 2019) when checking whether disagreements of observations between this dataset and UCDP-BRDD exist. For the detailed information of original sources of the above variables collected in the QoG, see Teorell et al. (2019). When calculating the 5-year geometric mean values of *Urban Population Growth* and *GDP Growth*, these mean values are expediently calculated, using the following formula: $\{\prod |x_i + |\min(x)| + 1|\}^{\frac{1}{5}} - [|\min(x)| + 1]$, where x_i represents either *Urban Population Growth* or *GDP Growth* in each half decade, and $\min(x)$ is the minimum value of each variable of *Growth* in the sample period.

B Spatial Terms in Matrix Notation

$\gamma \sum_{j \neq i} w_{ij,t} G_{j,t-1}$ and $\lambda \sum_{j \neq i} w_{ij,t} u_{j,t}$ in Eq. (1) are written as:

$$\begin{aligned}
 & \gamma \sum_{j \neq i} w_{ij,t} G_{j,t-1} \\
 = & \gamma \left[\begin{array}{cccccc} \begin{matrix} 0 & w_{1,2} & w_{1,3} & \cdots & w_{1,N} \\ w_{2,1} & 0 & w_{2,3} & \cdots & w_{2,N} \\ w_{3,1} & w_{3,2} & 0 & \vdots & \\ \vdots & \vdots & & \ddots & \\ w_{N,1} & w_{N,2} & \cdots & w_{N,N-1} & 0 \end{matrix} & \begin{matrix} O_{2000} & O_{2000} & & & O_{2000} \\ & \ddots & O_{2005} & & O_{2005} \\ & & O_{2010} & \ddots & O_{2010} \\ & & & & O_{2015} \\ & & & & O_{2015} \end{matrix} & \begin{matrix} \begin{matrix} 0 & w_{1,2} & w_{1,3} & \cdots & w_{1,N} \\ w_{2,1} & 0 & w_{2,3} & \cdots & w_{2,N} \\ w_{3,1} & w_{3,2} & 0 & \vdots & \\ \vdots & \vdots & & \ddots & \\ w_{N,1} & w_{N,2} & \cdots & w_{N,N-1} & 0 \end{matrix} \\ 2015 \end{matrix} \end{array} \right] \begin{bmatrix} G_{1,1995} \\ \vdots \\ G_{N,1995} \\ G_{1,2000} \\ \vdots \\ G_{N,2000} \\ G_{1,2005} \\ \vdots \\ G_{N,2005} \\ G_{1,2010} \\ \vdots \\ G_{N,2010} \end{bmatrix}
 \end{aligned}$$

$$\begin{aligned}
 & \lambda \sum_{j \neq i} w_{ij,t} u_{j,t} \\
 = & \lambda \left[\begin{array}{cccccc} \begin{matrix} 0 & w_{1,2} & w_{1,3} & \cdots & w_{1,N} \\ w_{2,1} & 0 & w_{2,3} & \cdots & w_{2,N} \\ w_{3,1} & w_{3,2} & 0 & \vdots & \\ \vdots & \vdots & & \ddots & \\ w_{N,1} & w_{N,2} & \cdots & w_{N,N-1} & 0 \end{matrix} & \begin{matrix} O_{2000} & O_{2000} & & & O_{2000} \\ & \ddots & O_{2005} & & O_{2005} \\ & & O_{2010} & \ddots & O_{2010} \\ & & & & O_{2015} \\ & & & & O_{2015} \end{matrix} & \begin{matrix} \begin{matrix} 0 & w_{1,2} & w_{1,3} & \cdots & w_{1,N} \\ w_{2,1} & 0 & w_{2,3} & \cdots & w_{2,N} \\ w_{3,1} & w_{3,2} & 0 & \vdots & \\ \vdots & \vdots & & \ddots & \\ w_{N,1} & w_{N,2} & \cdots & w_{N,N-1} & 0 \end{matrix} \\ 2015 \end{matrix} \end{array} \right] \begin{bmatrix} u_{1,2000} \\ \vdots \\ u_{N,2000} \\ u_{1,2005} \\ \vdots \\ u_{N,2005} \\ u_{1,2010} \\ \vdots \\ u_{N,2010} \\ u_{1,2015} \\ \vdots \\ u_{N,2015} \end{bmatrix},
 \end{aligned}$$

where O_t is the zero matrix at t . O_t is an $N \times N$ matrix when $\forall N_t = N$, where N_t represents the number of observations at t . My data set is unbalanced. Thus, the number of observations, N_t , is different in each period as follows: 125 in the sample using HALE₂₀₀₀, 133 in the sample using HALE₂₀₀₅, and 135 in the samples using HALE₂₀₁₀ and HALE₂₀₁₅ (i.e., $\forall N_t \neq N$). In the above equations, for simplicity, N_t is denoted by N . Moreover, the borders are not stable. Therefore, $w_{ij,t}$ may differ every half decade t .

C Descriptive Statistics

The variables are defined as in Section A. *GDP per capita* and *Population* are log-transformed in the analysis because their distributions are skewed.

Table A2: Descriptive Statistics

Variable	N	Mean	SD	Min	Max
HALE	528	60.940	8.585	35.6	74.7
Wartime _{t-1}	528	0.258	0.438	0	1
<i>spillover</i> (Wartime _{t-1})	528	0.280	0.323	0	1
Intensity _{t-1}	528	0.674	2.400	0.000	22.891
<i>spillover</i> (Intensity _{t-1})	528	0.794	1.427	0.000	12.528
<i>unweighted spillover</i> (Intensity _{t-1})	528	2.641	4.727	0.000	27.970
Population _{t-1}	528	42316198.449	145781874.753	339722	1324505000
Urban Population Growth _{t-1}	528	2.342	2.008	-3.079	14.649
Secondary School Enrollment _{t-1} (%)	528	68.142	32.504	5.338	158.555
GDP per capita _{t-1}	528	14562.197	17609.488	372.694	119869.122
GDP Growth _{t-1}	528	3.677	5.116	-31.407	48.634
Polity Score _{t-1}	528	3.766	6.276	-10	10

Note: Wartime is a binary variable. Intensity is battle-related deaths divided by 1000.

D Detailed Results for All Models

Figure A1 displays a full-color version of Figure 2.

Figure A1: Direct and Spillover Effects of Civil War on HALE (Full-Color Version)

Note: For additional detail, see Notes to Figure 2.

The following tables show the detailed results of the regression analyses. All TSCS models include country FEs and a variable for either trend or 5-year FEs. Coefficients of the direct and spillover effects of civil war in all models are presented in A1 and A2 of Figure 2.

Table A3: Results of Spatial Cross-Sectional Analysis

	Wartime

** $p < 0.01$, * $p < 0.05$, [†] $p < 0.1$

Notes: Definition of *Civil War* is given in parentheses in each model name. Instead of using a variable for trend, Models A5.3 and A5.4 employ 5-year FEs.

As Figure 1 suggests, HALE shows an upward trend. Instead of using the unit-invariant half-decade FEs, Models A5.1 and A5.2 employ a variable for trend. Model A5.3 analyzes spillover effects by employing the binary variable for whether any contiguous country experiences civil wars that Ghobarah, Huth and Russett (2004) and Shikano and Eckert (2011) used. Model A5.4 estimates the spillover effects of civil wars by using the unweighted total sum of battle-related deaths in contiguous countries that Shikano and Eckert (2011) employed.
